QUANTUM MECHANICS

ANSWERS

## Quantum Theory Challenge ANSWERS

31

**Your Job:** To create a "new" periodic table of the elements for the first 116 elements that would result from the following allowed values of the "new" set of quantum numbers.

"New" Allowable Quantum Numbers:

$n = 1$  to infinity

$l = 0$  to  $n$  (changed from 0 to  $n-1 \rightarrow$  this is the only change.)

$m_l = -l$  to  $+l$

$m_s = +\frac{1}{2}$  and  $-\frac{1}{2}$

In constructing your periodic table you are to assume that "all other factors remain equal". ie) the diagonal filling pattern of sublevels etc. would be the same as the regular universe. This would probably not be the case but it simplifies the task.

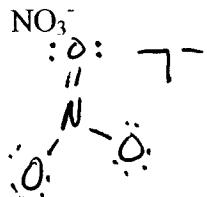

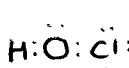

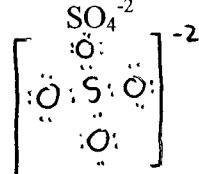

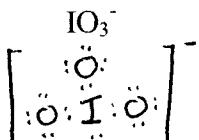

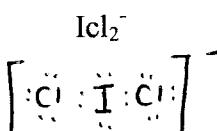

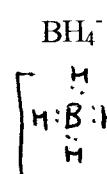

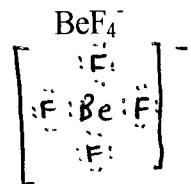

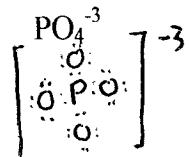

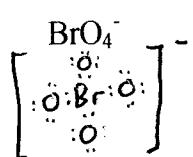

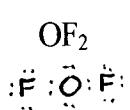

Now that you know what the periodic table would look like in this new universe answer the following questions.

- |  |                                     |
|--|-------------------------------------|
| 1. Most reactive non-metal   | <u>N</u>                            |
| 2. Two major components of air   | <u>B&amp;C</u>                      |
| 3. Element that would form the basis of life   | <u>Be</u>                           |
| 4. Highest oxidation state of aluminum   | <u>+5</u>                           |
| 5. Element that would build strong bones   | <u>Ar or Kr</u>                     |
| 6. People with high blood pressure should avoid this   | <u>ClP</u>                          |
| 7. Most reactive alkali metal  | <u>At</u>                           |
| 8. Charge on a CH ion  | <u>-1</u>                           |
| 9. Elements at the beginning and end of period 6   | <u>At &amp; 116</u>                 |
| 10. Element that is the major component of steel   | <u>Cr</u>                           |
| 11. Most reactive metal  | <u>At</u>                           |
| 12. Smallest Halogen   | <u>N</u>                            |
| 13. Element used in the Goodyear blimp   | <u>O</u>                            |
| 14. Would the blimp still fly?   | <u>yes</u>                          |
| 15. All the diatomic elements  | <u>H N C B P AS Sb</u>              |
| 16. Common oxidation states of gold  | <u>+1, +3</u>                       |
| 17. Formula of Argon aluminide   | <u>Ar<sub>3</sub>Al<sub>2</sub></u> |
| 18. Most electronegative element   | <u>N</u>                            |
| 19. The "new" gold   | <u>Ir</u>                           |
| 20. The two elements in the first period that have lower ionization energy than the element that directly precedes them. | <u>Li, C</u>                        |

## Rules for Drawing Lewis Structures

## VSEPR Theory

### Rules for Finding Lone Pairs of Electrons

## Chart of Bonding Type & Substance

### Solutions

Compound	Bonding Type
Carbon tetra chloride	molecular
Water	molecular
Dry Ice	molecular
Sodium Chloride	ionic
Lead (II) Bromide	ionic
Silver Chloride	ionic
Sodium	metallic
Copper	metallic
Iron	metallic
Carborundum	covalent network
Sand	covalent network
Para Dichloro benzene	ionic
